

Functions

A **function** (called a **method** in Java) is a reusable block of code that performs a specific task.

Why Use Functions?

- **No Copy-Pasting:** Instead of writing the same 10 lines of code in 5 different places, you write it once inside a function and just call its name.
 - **Cleaner Code:** It breaks a massive, messy program down into small, organized, easy-to-read pieces.
-

The Anatomy of a Basic Function

```
public static int addNumbers (int num1, int num2) {
```

```
    int sum = num1 + num2; ◀— Function Body (The actual code block that does the work)
```

```
    return sum; ◀— Return Statement (output, exit door = data the function will give back to you when it finishes job. Keyword void = If a function doesn't give anything back.)
```

```
}
```
